Complete Cockroach Control

Protect your Reputation, Profitability, and
Your Customer

When a cockroach appears at a customer's home or business, it can jeopardize your business relationship and reputation. These cockroach sightings are often linked to using less-effective products or incomplete pest control strategies. As a result, you may risk losing a valued customer and end up investing additional time and resources to correct the problem.

BASF Complete Cockroach Solution reduces risk of cockroach infestations and protects what matters most – your and your customers' reputations, local health department ratings, and profitability. Implement the most effective strategies and use innovative and advanced, proven cockroach control products from BASF, and roaches won't stand a chance.

Challenge Bait Aversion

Bait aversion can occur when a single gel bait product is used for a prolonged amount of time for cockroach control.

Best Practice

To eliminate the potential for bait aversion, rotate baits formulated with different food ingredients every three to six months. Exposing cockroaches to a varied menu is the key to effective management.

- Continuous Rotation
- Use multiple baits with different food ingredients
- Use Integrated Pest Management techniques

BASF Solution

Alpine® Cockroach
Gel Bait Rotation 1
Reservoir

Alpine® Cockroach
Gel Bait Rotation 2
Reservoir

Avert® DF
Dry Flowable
Cockroach Bait

Challenge Repellency

When repellent insecticides, such as many pyrethroids, are applied, cockroach infestations will often fragment and spread. This may account for the unfortunate sightings of cockroaches in sensitive areas like dining rooms and reception areas. Additionally, the use of repellent materials near bait deposits may deter or prevent cockroaches from feeding on the bait.

Best Practice

To protect you and your customers' reputations, it's important to prevent unfortunate cockroach sightings and bait contamination during and following treatment.

- Use non-repellent insecticides
- Avoid using repellent insecticides:
 - near or where bait is used
 - where cockroach scattering could create issues or concerns

BASF Solution

Alpine® WSG
Water Soluble Granule
Insecticide

PT® Alpine®
Pressurized Insecticide

Phantom®
Termiticide-Insecticide

PT® Phantom® II
Pressurized Insecticide

Use Non-Repellents

Challenge

Chemical Resistance

**Non-resistant
Cockroach**

Insect Dies

**Resistant
Cockroach**

Insect Survives

Pesticide resistance occurs when insects no longer react negatively to a particular active ingredient at the same level they once did.

These survivors reproduce and pass on their resistance to their offspring.

Ultimately, a once-effective product no longer controls cockroaches because the population is now resistant to the active ingredient.

Best Practice

How can you prevent or overcome chemical resistance?

- Use products containing different modes of action, active ingredients, and classes of chemistry
- Rotate products with different modes of action regularly
- Use Integrated Pest Management techniques
- Focus your treatment plan around non-repellent products

Challenge

Complex Treatment Areas

When servicing an entire facility, a Pest Management Professional might be inclined to only inspect and treat easily-accessible areas and surfaces — leaving deep harborage untreated. Always divide the space into smaller focus zones.

Best Practice

A focus-zone approach during successive visits can be the key to superior cockroach control.

1. Divide the account into manageable focus zones.
2. Focus service efforts on the microhabitats where roaches are most likely to live within each zone.
3. Rotate the focus zones that will be treated at each service visit.
4. Use sticky traps to monitor all zones for quick and easy inspection of areas not being serviced.
5. Use products and application techniques most suitable for each microhabitat.

BASF Solution

Comprehensive Pest Management Training

Alpine® WSG Water Soluble Granule Insecticide
PT® Alpine® Pressurized Insecticide

Alpine WSG insecticide and **PT Alpine** pressurized insecticide are proven, fast-acting, non-repellent formulations that do not scatter roaches, contaminate gel bait placements, or deter cockroaches from feeding on bait. Both products are easy to use and offer versatile labels that permit Crack & Crevice®, void, and spot treatments even when food handling establishments are in operation. With **Alpine WSG** insecticide and **PT Alpine** pressurized insecticide, the risk of roach sightings is decreased and cockroaches will eat the bait.

Phantom® Termiticide-Insecticide
PT® Phantom® II Pressurized Insecticide

Phantom termiticide-insecticide and **PT Phantom II** pressurized insecticide are unmatched, high performing, non-repellent insecticides that manage cockroach resistance and aversion. Unlike other insecticides, these products work by disrupting the cockroach's energy production in its cells. The active ingredient is converted by the roach's own metabolic processes into a form that targets and eliminates them efficiently. For decades, Phantom has been tested on numerous German cockroach strains and no resistance has been found.

Alpine® Cockroach Gel Bait Rotation 1 & 2 Reservoirs

Alpine cockroach gel bait rotation 1 & 2 reservoirs are the solution to breaking the cycle of cockroach bait aversion. This attractive, fast-acting, and reliable rotational gel bait duo contains dinotefuran, the only active ingredient granted Reduced Risk Status by the EPA for use in both public health and food handling establishments. With very different food ingredients in each formulation, **Alpine** cockroach gel bait rotation 1 & 2 reservoirs will vary the menu to cockroaches, reducing the risk of bait aversion and increasing cockroach control.

Avert® DF Dry Flowable Cockroach Bait

Avert DF cockroach bait is a unique cockroach bait that will go where no gel bait can go. Penetrating deep into cracks, crevices, voids, and even under appliances, this highly attractive and efficient bait allows you to apply a bait to challenging areas where roaches are known to live, breed, and hide. Cockroaches obtain a lethal dose by consuming the bait through direct feeding and Pick-n-Preen behavior. Whether roaches are hungry or not, **Avert DF** cockroach bait is considered a resistance buster that consistently controls resistant strains.
